INCIPIIT

Sanders Architects state that «*as humans and biological elements, building have a skin. [...] The skin has a responsibility to protect the contents, much like our skin protects us. It also makes a bulging unique, recognisable. [...] Given these complex duties, skin [...] show[s] the "body" of the volumes*». [1]

In this Urban Corporis volume, "The city and the skin", we asked the authors to read, define and interpret the role of the skin as a facade, as a protection, as a compositional image of urban revelation. Without formal restrictions, without ethical preconceptions: the skin as part of the building designed to mediate the relationship.

The architectural skin, understood as the technological system of delimitation between architectural space and unbuilt environment, can be analyzed as a boundary system between interior and exterior, the most evident expression of the identity of an artifact. In this dual role of border and interface, receptive as active, the skin of an architecture (seen also through art) is charged with a double value: an element of covering and protection and, at the same time, a tool of relationship and interface, in fact, towards the external world.

PERCEPTION

PERCEPTIVE LANDMARKS

Superficial and visceral experiences

Mickeal Milocco Borlini

Ph.D. in Architecture - Theory and Design

PostDoc Researcher at University of Udine, Italy

Skin, noun

The thin layer of tissue; the thin layer of tissue; a container made from the skin of an animal such as a goat, used for holding liquids; the peel or outer layer of certain fruits or vegetables; the outermost layer of a structure such as a building or aircraft; any outer covering ; a thin, solid surface.¹

If we consider the city as a set of objects, it is easy to understand how their presence becomes a perennially observable and/or perceptible scenario. The urban elements that are “building” our cities are part of what could be observed; more precisely their envelope, their volume and their skin: we can look at it, touch it, vandalistically engrave it, tag it and so on. The perception of the skin of our cities becomes a fundamental element for better understanding that layer that divides the exterior and interior of the buildings in which and between which - at different levels - all the possibilities of daily life are manifested.

¹ Skin: <https://dictionary.cambridge.org/dictionary/english/skin>, 05/2019.

We live through the skin [...] we live through the skin too distant to speak of separation; we [...] live through the skin of glimpses.

(R. Krynicki, *Magnetic Point: Selected Poems*, New Directions Publishing, 2017)

From this extract by R. Krynicki we can deduce that we live the city through our naturally innate sensory tools, with an emphasis on sight and touch. The urban perceptual aspect becomes essential in the interaction between the user and the built environment; this can vary thanks to a different treatment of the internal or external cladding of buildings and also from the way in which the volumes (vertical and horizontal) are positioned and exposed on a street; those are glimpses, perspectives in which the user can have a different perception of space and will be able to orientate, knowing where to go and understanding what it can touch or avoid. The surfaces of our cities have “organic” and “living” connotations, exactly like our epidermis;² in fact “as human beings and biological elements, the building has a skin. [...] The skin has a responsibility to protect the content, just as our skin protects us. [...] Given these complex tasks, the skin shows [...] the “body” of the volumes”.³

2 Teknoring, *Involucro edilizio come pelle e membrana*, <https://www.teknoring.com/guide/guide-edilizia-e-urbanistica/inv-lucro-edilizio-come-pelle-e-membrana/05/2019>

3 Sander Architects, 2017, <https://www.sander-architects.com/single-post/2017/09/12/Building-Skin-Whats-In-A-Face> (02/2019).

The skin of the city should be designed to mediate the relationship between human beings and the environment; the direct correlation of the user with the architectural organism can be associated in the way in which our cells interact biologically between them, opening up to new design and urban conceptualizations in which two symbiotic systems must evolve for a “common good”. Therefore the use, possession, interaction with a settlement system (set of objects) can generate different kinds of tactile, emotional and perceptual responses that have *visceral* and *behavioral* effects, referring to the functionality and the interaction that occurs using the urban space (Norman, 2004). The design approach that is manifested through the use of an interface (man’s skin -the skin of the city) must bring the attention from the concept of “user” to the concept of “person” leading to participation and involvement, based on the principle that those involved in the use of a product - of the city in this case - must be directly involved in its design.⁴

Pursuing the study of the interactions between a person and a set of object (i.e. the city) and the resulting actions between them, can help understanding the architectural process towards a more inclusive urban environment; the user needs and experiences are fundamental to understand the city’s taxonomies and to improve the critical issues that a person may encounter during the interaction with the “product-city” (Pizzoccaro, Figiani 2009).

4 Summary of the Research project held at University of Udine: “Worksite City”, Tubaro G., Milocco B. M., 2019

We can say that the stimulation of the urban epidermis can be summarized as the set of responses of our (human) senses in a given architectural context, both internal or external. The "presence" of the surfaces can help orientation in "disorienting and uniform"⁵ urban spaces. Way-finding becomes a fundamental part of the surfaces of our cities: indicating, interrupting, warning, alerting and surprising.

Wiel Arets defines the human surface "skin, veins and bones"⁶ as an essential element, which can bring the architectural system back to the organic one in a set of elements that decree the contact or separation between different areas;⁷ consequently the surfaces can "vary, expose themselves, show, regenerate and degenerate" "just like our cities."⁸ Therefore, urban processes must take into consideration social and architectural stratifications because, as Malagugini (2007) recalls, citing G. Leibniz, "*space is relational*";⁹ it is clear that in the context of a sensorial and inclusive design, it cannot be ignored the relationship between space, objects and user, who is the person that "touches" the city, even with his eyes.

5 SuperAbile (2006), <https://mysuperabile.inail.it/cs/superabile/percorsi-aromatici-mappe-tattili-luci-soffuse-e-la-progettaz.html>, 10/2019

8 Sander Architects, 2017

9 Leibniz G., IV lettera a Clarke, par. 10 e 16, 1716

Therefore if the urban space is subjective (Malagugini, 2007) so it is the interpretative perception of itself and cognitive strategies that redefine places according to elements of reference and recognition are really necessary, to improve - as much as possible the "dimension", the "depth" and perception of places. To do this it is necessary to take into account the different sensory aspects of people, to proceed with coherent, adaptable and constantly evolving interventions (Law, 2004; Howes, 2005). The adaptability of an urban system manifests itself in social and economic areas that are continuously evolving according to the needs of their users, so - in this case - in the interaction between objects and users of a given urban system (Celucci 2018) . Studying the different ways of relating between the city and a specific group of users, analyzing the dynamics that exist precisely in the "contact" between them and the services and routes (scattered over the territory to be examined), would lead to the outcome of a more easily perceptible and experienced city, through all the senses. The visual "contact" between the skin of the human being and the urban organism should be improved to facilitate the identification of identity elements, to easily grasp the size and spatial depth of the urban sections and also the city itineraries while contrasting - where possible - the disorienting schizophrenia of the "dresses" of today's cities.¹⁰

10 From a conversation with Ferraro F., 2019

The direct perceptive presence of the artifacts, synthesizing the words of W. Rybczynski by D. Howes (2005), is given by the emotional reactions that it manages to release - on site - together with the poly-sensory reactions given by the physical composition of the human beings and the environment around them. Identifying through the words "mediation" and "reconciliation" the space and its perception (Howes, 2005) leads to an interpretation of the architecture "of the senses" as part of a relationship process as an environmental and social interaction (Human Centered Design), where the user is at the center of the process (Pratt, Nunes, 2012). The intention is to increase the awareness of multi-sensory design processes, "Sensory Design" (Malnar, Vodvarka, 2003), which takes into account the user's cognitive aspects by using visual, tactile and auditory devices that facilitate the interaction between the human being and the space that surrounds him (Conti et. al., 2019). The user's cognitive and kinetic abilities must be studied to improve a specific urban area (set of objects) and to reconfigure its size and location in space (Mallgrave, 2015): "architecture has always been first of all something to experience with the body and with the senses".

Architecture therefore, as J. Pallasmaa (2007) argues, should "accommodate and integrate", perceptually and sensorially including all human beings in a continuous renegotiation of perceptual experiences that are established between the user and the built environment (Pallasmaa, 2007). Tactile experiences, interactive facades,

roads and visually redefined paths - through the use of color or a different texture - can redefine and outline the identity characteristics of a place, not only from a "panoramic" point of view, but also thanks to the possibility of being touched, experienced, stimulating a set of emotional and cognitive reactions that can make an urban environment memorable: a *perceptive landmark*. The city, which is a set of objects to interact with, acquires a poetic that distances itself from the typical formal anonymity of the "*unflavored international style*".¹¹

All Italian quotations have been translated by the author.
