

Depicting vegetation dynamics along the Tagliamento river bars: a remote sensing approach to monitor biodiversity in alpine rivers

Giacomo Boscarol¹, Giacomo Trotta^{2,1}, Maurizia Sigura¹, Valentino Casolo^{1,3}, Elisa Pellegrini¹, Giorgio Alberti^{1,3}, Marco Vuerich^{1,3}, Daniel Moro^{2,1}, Sara Gargiulo^{2,1}, Edoardo Asquini^{4,1}, Paolo Cingano^{2,1}, Danièle Lagnaz⁵, Florent Jouy⁶, Jana Chmielecki⁷, Michał Habel⁸, Dawid Szatten⁸, Marta Brzezińska⁸, Francesco Boscutti^{1,3}

Funded by Erasmus+ Programme KA1-Blended Intensive Programme project: "Monitoring Alpine River Dynamics from a biodiversity and landscape perspective"

7th European Congress of Conservation Biology

RIVER DYNAMICS

Initial state – grasslands, shrublands and woodlands

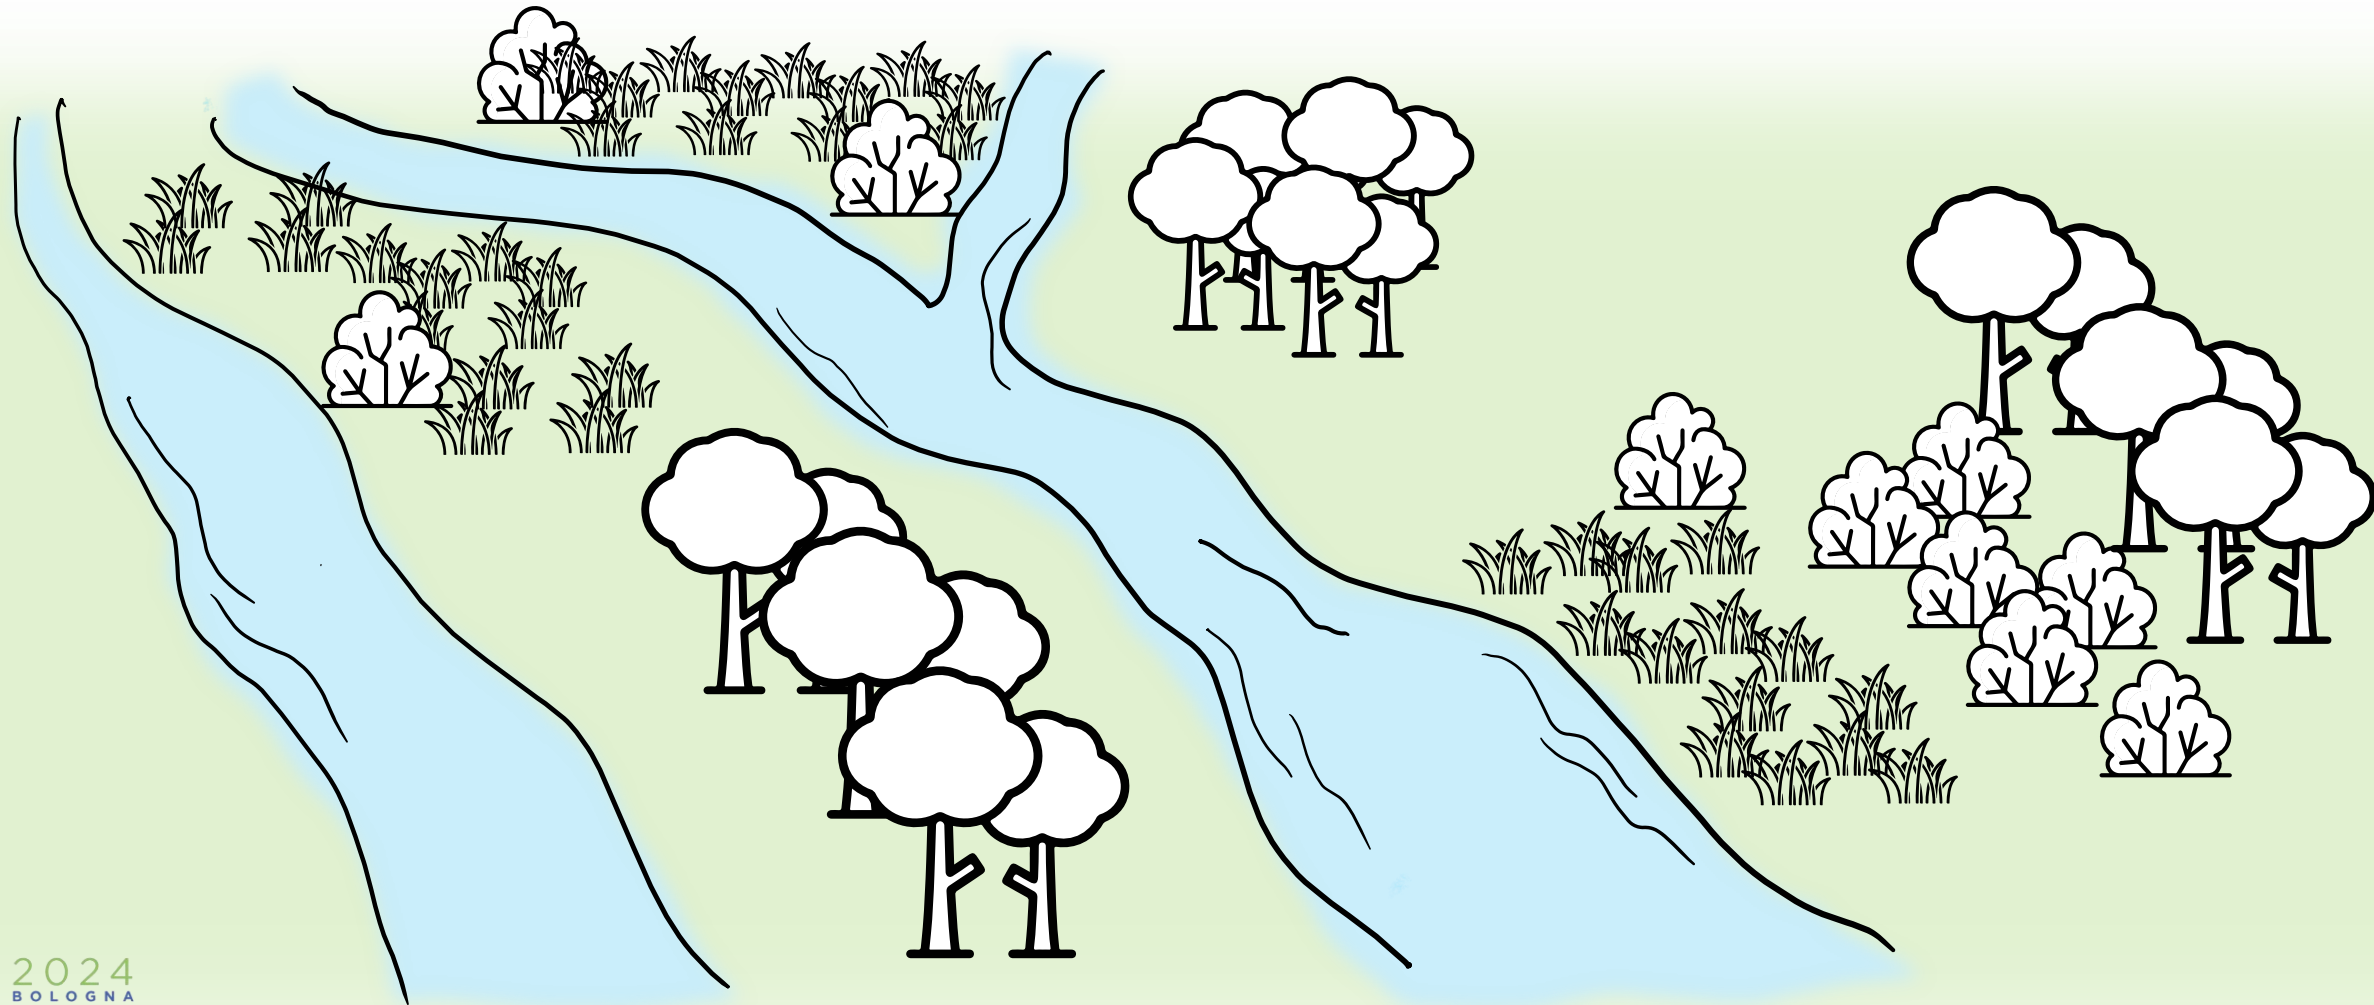

RIVER DYNAMICS

Vegetation dynamics – spatial growing

RIVER DYNAMICS

Vegetation dynamics – ecological successions

RIVER DYNAMICS

River dynamics – flood event

RIVER DYNAMICS

River dynamics – returned to bare soil

RIVER DYNAMICS

River dynamics – the ecological succession starts over

STUDY AREA: Tagliamento river

In the N-E part of Italy

One of the **most well-preserved** river in Europe

Characterized by:

- 🔍 a **wide** pristine gravel-bed
- 🔍 frequent **flood** events
- 🔍 **river bars** with complex habitats

Subjected to nature conservation initiatives

STUDY AREA

Identified 51 plots of 100m² each in 4 consecutive parts of the Tagliamento river (N-E Italy)

AIM OF THE STUDY

Understand how satellites recognize different **vegetation stages**

A useful tool for implementing effective conservation strategies

AIM OF THE STUDY

Understand how satellites recognize different **vegetation stages**

A useful tool for implementing effective conservation strategies

Find out which are the vegetation's **dynamics** over the last **40 years**

What satellites can tell us about **time trends** of dynamic systems

MATERIALS AND METHODS

MATERIALS AND METHODS

Funded by Erasmus+ Programme KA1-
Blended Intensive Programme project:
"Monitoring Alpine River Dynamics from a
biodiversity and landscape perspective"

In the 51 plots:
Performed floristic surveys (species name and habitus)
Collected soil data (analyses are still ongoing)

In 2022 and 2023
Erasmus+ program involving
4 European countries

MATERIALS AND METHODS

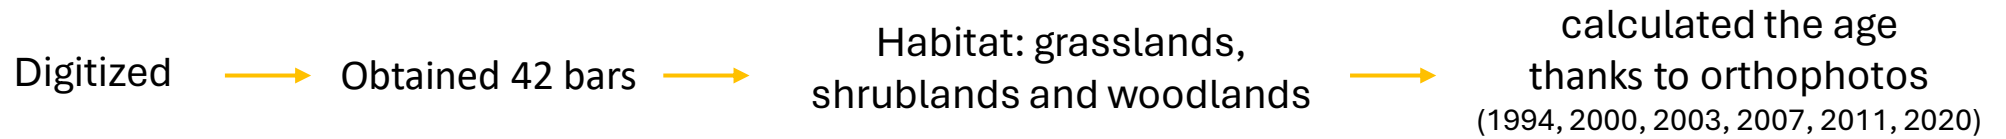

Funded by Erasmus+ Programme KA1-Blended Intensive Programme project: "Monitoring Alpine River Dynamics from a biodiversity and landscape perspective"

In the 51 plots:
Performed floristic surveys (species name and habitus)
Collected soil data (analyses are still ongoing)

In 2022 and 2023
Erasmus+ program involving
4 European countries

MATERIALS AND METHODS

Funded by Erasmus+ Programme KA1-Blended Intensive Programme project: "Monitoring Alpine River Dynamics from a biodiversity and landscape perspective"

In the 51 plots:
Performed floristic surveys (species name and habitus)
Collected soil data (analyses are still ongoing)

In 2022 and 2023
Erasmus+ program involving
4 European countries

Digitized

Obtained 42 bars

Habitat: grasslands,
shrublands and woodlands

calculated the age
thanks to orthophotos
(1994, 2000, 2003, 2007, 2011, 2020)

Calculated the NDVI index from the 2023 Landsat 8 images

$$\text{NDVI} = \frac{(\text{NIR} - \text{Red})}{(\text{NIR} + \text{Red})}$$

MATERIALS AND METHODS

Funded by Erasmus+ Programme KA1-Blended Intensive Programme project: "Monitoring Alpine River Dynamics from a biodiversity and landscape perspective"

In the 51 plots:
Performed floristic surveys (species name and habitus)
Collected soil data (analyses are still ongoing)

In 2022 and 2023
Erasmus+ program involving
4 European countries

Digitized → Obtained 42 bars → Habitat: grasslands, shrublands and woodlands → calculated the age thanks to orthophotos (1994, 2000, 2003, 2007, 2011, 2020)

Calculated the NDVI index from the 2023 Landsat 8 images

$$\text{NDVI} = \frac{(\text{NIR} - \text{Red})}{(\text{NIR} + \text{Red})}$$

Created models between NDVI in 2023, bar age, habitat, habitus, species richness

MATERIALS AND METHODS

MATERIALS AND METHODS

Annual NDVI index from Landsat images
Spatial resolution: 30x30m per pixel

<i>Time interval</i>	<i>Satellite</i>
1988 – 2011	Landsat 5
2013 – 2023	Landsat 8

MATERIALS AND METHODS

Annual NDVI index from Landsat images
Spatial resolution: 30x30m per pixel

<i>Time interval</i>	<i>Satellite</i>
1988 – 2011	Landsat 5
2013 – 2023	Landsat 8

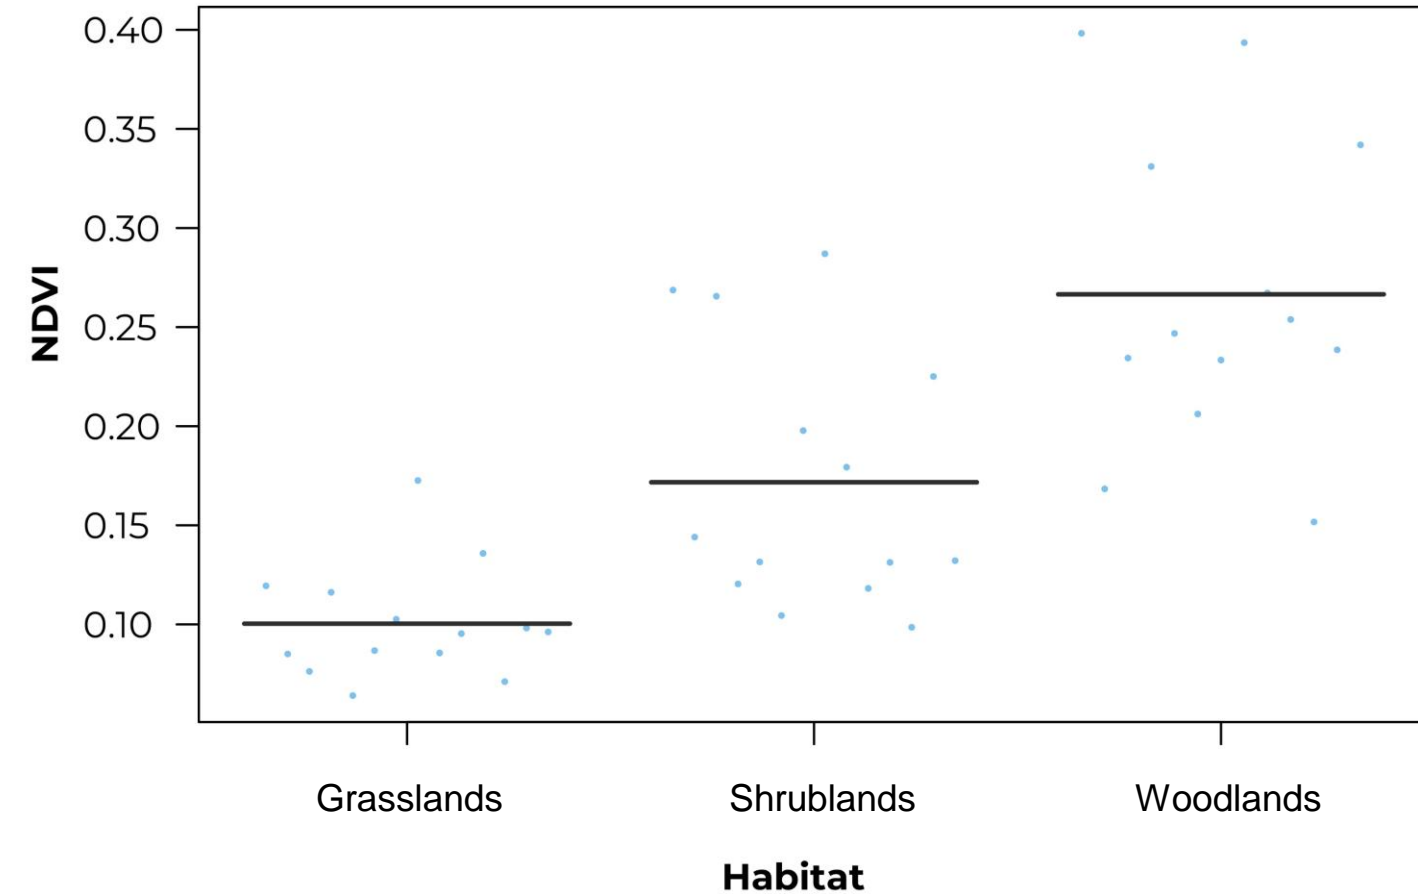

Created models between annual NDVI and bars age

RESULTS: NDVI ~ community structure

RESULTS: NDVI ~ community structure

Direct proportionality between the progression of the ecological succession and NDVI

$R^2 = 0.56$

	<i>NumDF</i>	<i>DenDF</i>	<i>F-value</i>	<i>p-value</i>
<i>Intercept</i>	1	36	350.695	<.0001
<i>Habitat</i>	1	36	253.844	<.0001

RESULTS: NDVI ~ community structure

Positive linear relation between the age of the bars and NDVI

	<i>NumDF</i>	<i>DenDF</i>	<i>F-value</i>	<i>p-value</i>	$R^2 = 0.74$
<i>Intercept</i>	1	37	350.695	<.0001	
<i>Age</i>	1	37	253.844	<.0001	

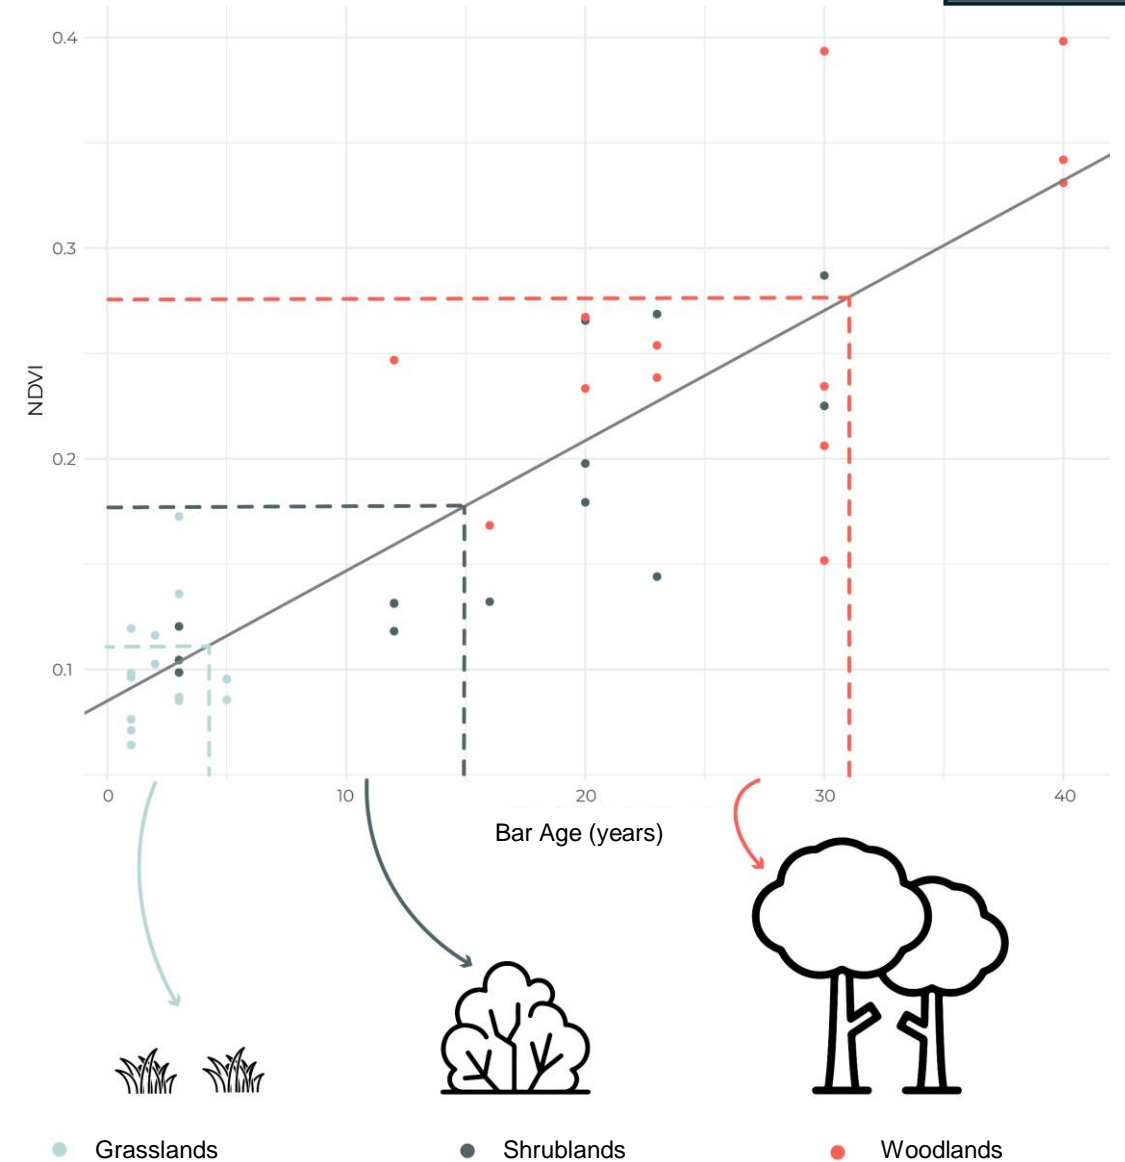

RESULTS: NDVI ~ community structure

Positive linear relation between the age of the bars and NDVI

	<i>NumDF</i>	<i>DenDF</i>	<i>F-value</i>	<i>p-value</i>	$R^2 = 0.74$
<i>Intercept</i>	1	37	350.695	<.0001	
<i>Age</i>	1	37	253.844	<.0001	

NDVI as a **proxy** of bar age

RESULTS: NDVI ~ community structure

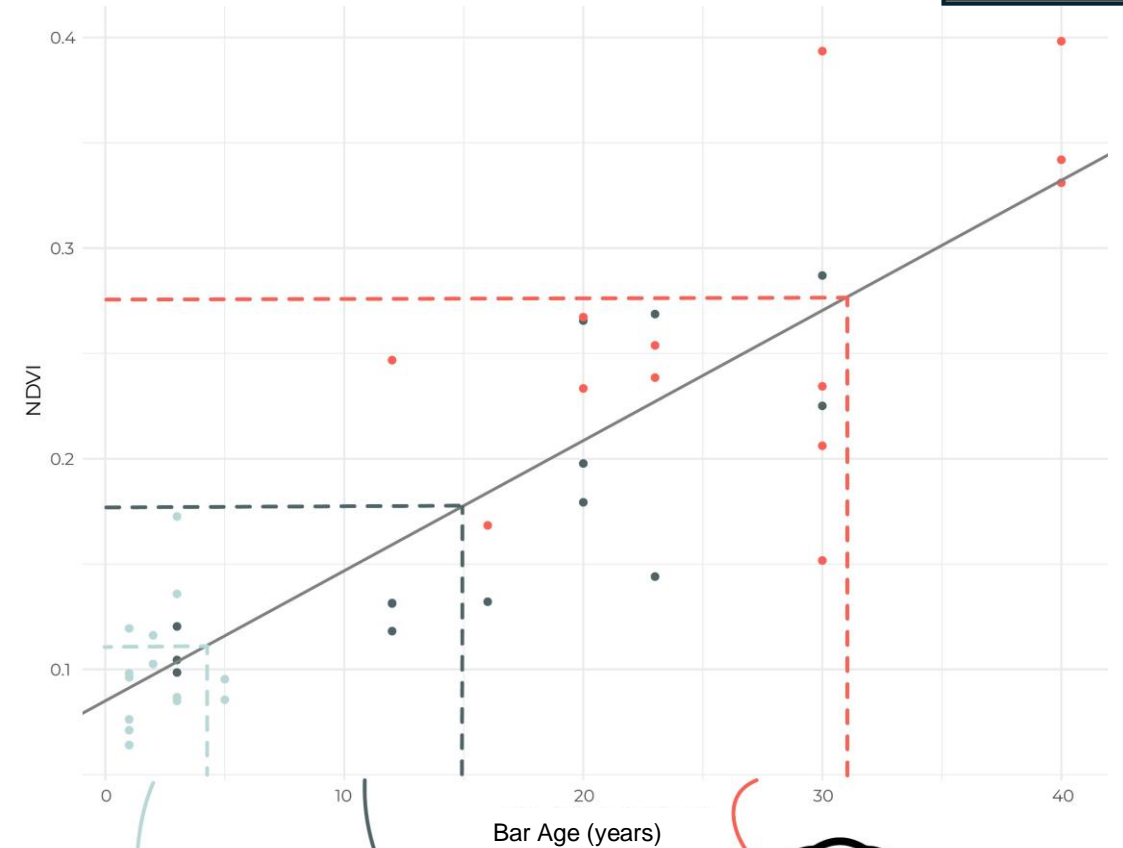

Positive linear relation between the age of the bars and NDVI

	NumDF	DenDF	F-value	p-value
Intercept	1	37	350.695	<.0001
Age	1	37	253.844	<.0001

$R^2 = 0.74$

NDVI as a **proxy** of bar age

Bar Age (years)	NDVI
< 5	0.03 – 0.17
5 – 10	No bars detected
10 – 30	0.12 – 0.28
> 30	> 0.3

● Grasslands

● Shrublands

● Woodlands

RESULTS: species richness ~ NDVI and habitus

RESULTS: species richness ~ NDVI and habitus

Habitus = growing form of a species

It reflects the ecological succession: species richness increases in time (proxy: NDVI)

$R^2 = 0.69$

	<i>NumDF</i>	<i>DenDF</i>	<i>F-value</i>	<i>p-value</i>
<i>Intercept</i>	1	78	723.677	<.0001
<i>NDVI</i>	1	39	253.844	.0006
<i>Habitus</i>	2	78	196.191	<.0001
<i>NDVI:Habitus</i>	2	78	11.854	<.0001

RESULTS: NDVI in the time series

RESULTS: NDVI in the time series

Time series: 1988 – 2023

Strong positive relation between bars' age (from 1988 to 2023) and annual NDVI

$R^2=0.52$

	<i>NumDF</i>	<i>DenDF</i>	<i>F-value</i>	<i>P-value</i>
<i>Intercept</i>	1	580	276.754	<.0001
<i>Age</i>	1	580	5.136	<.0001

Low number of «old» bars (dynamic system)

CONCLUSIONS

NDVI has been confirmed to be a good indicator of the **bar age** and the **ecological succession's stage**

CONCLUSIONS

NDVI has been confirmed to be a good indicator of the **bar age** and the **ecological succession's stage**

NDVI can be used as **indicator** of the **species richness** only within the habitus, while it is less useful when the 3 habitus are considered together

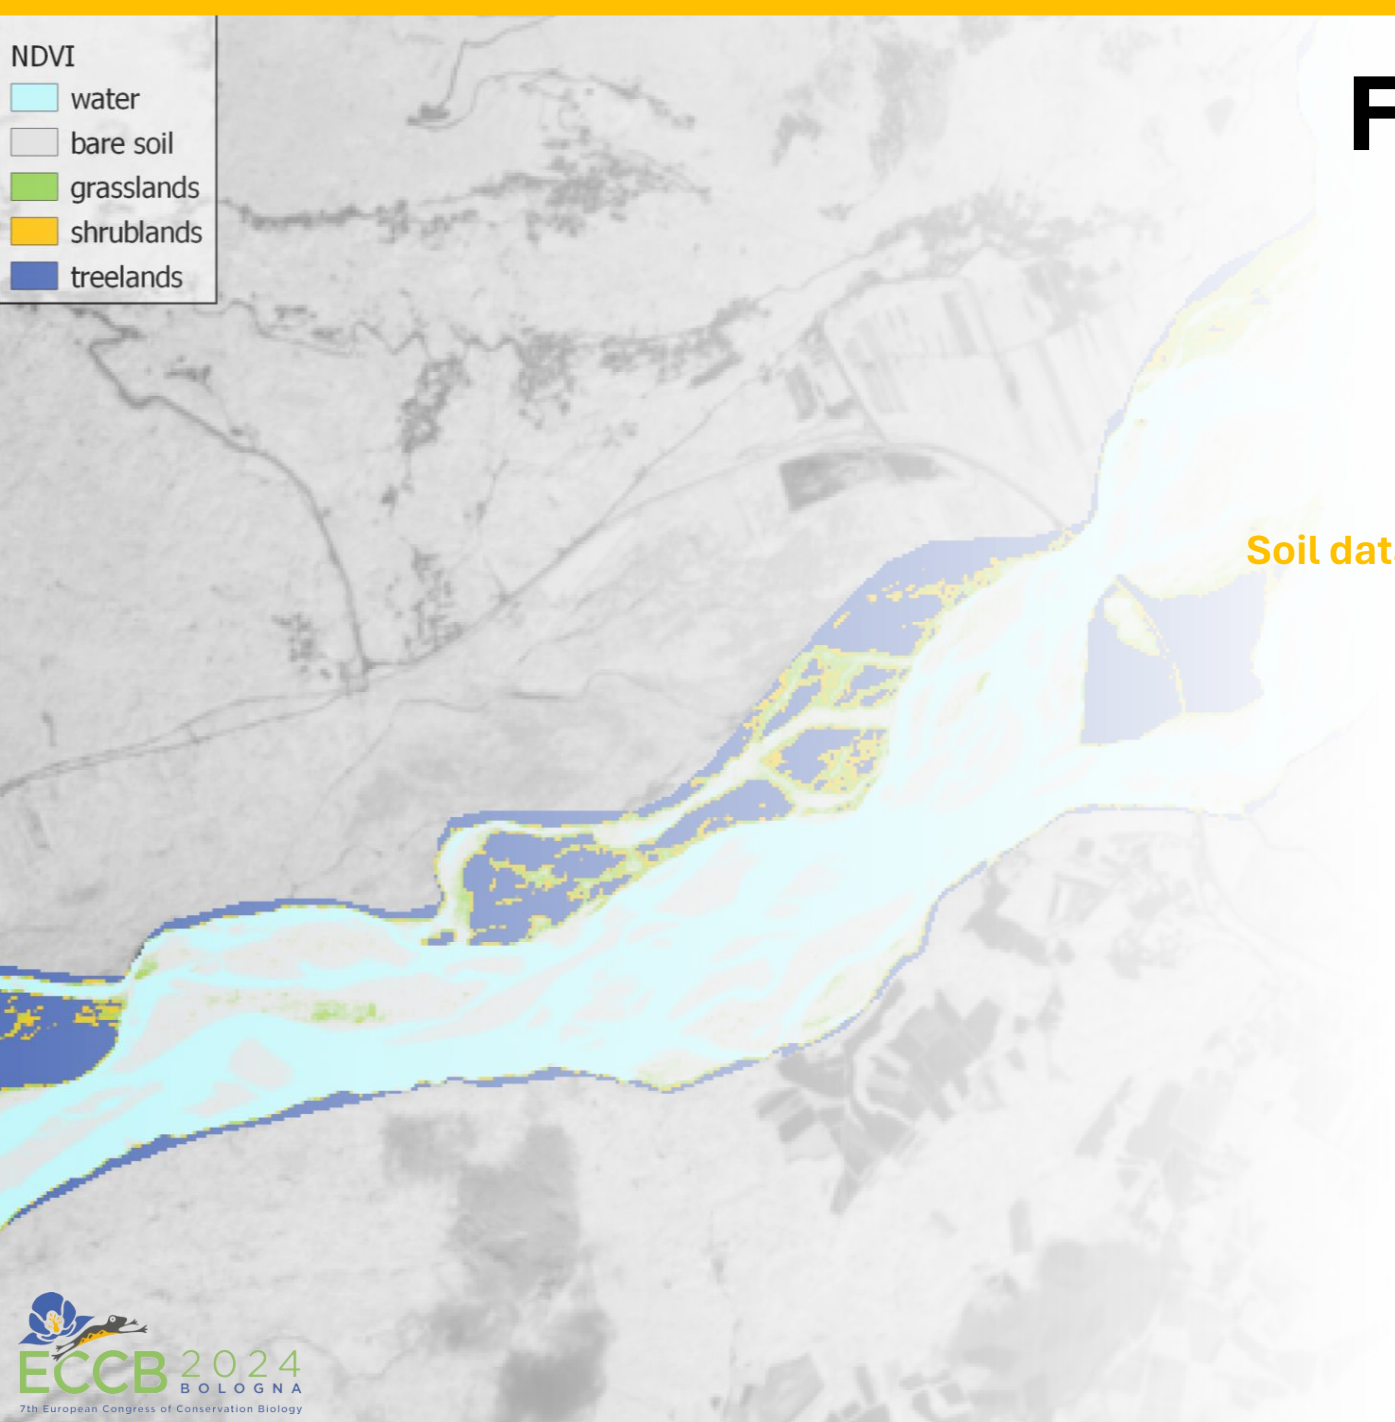

CONCLUSIONS

NDVI has been confirmed to be a good indicator of the **bar age** and the **ecological succession's stage**

NDVI can be used as **indicator** of the **species richness** only within the habitus, while it is less useful when the 3 habitus are considered together

NDVI can be used to graph the multispectral **history of the bars** and to understand how the **fluvial dynamics** influences it

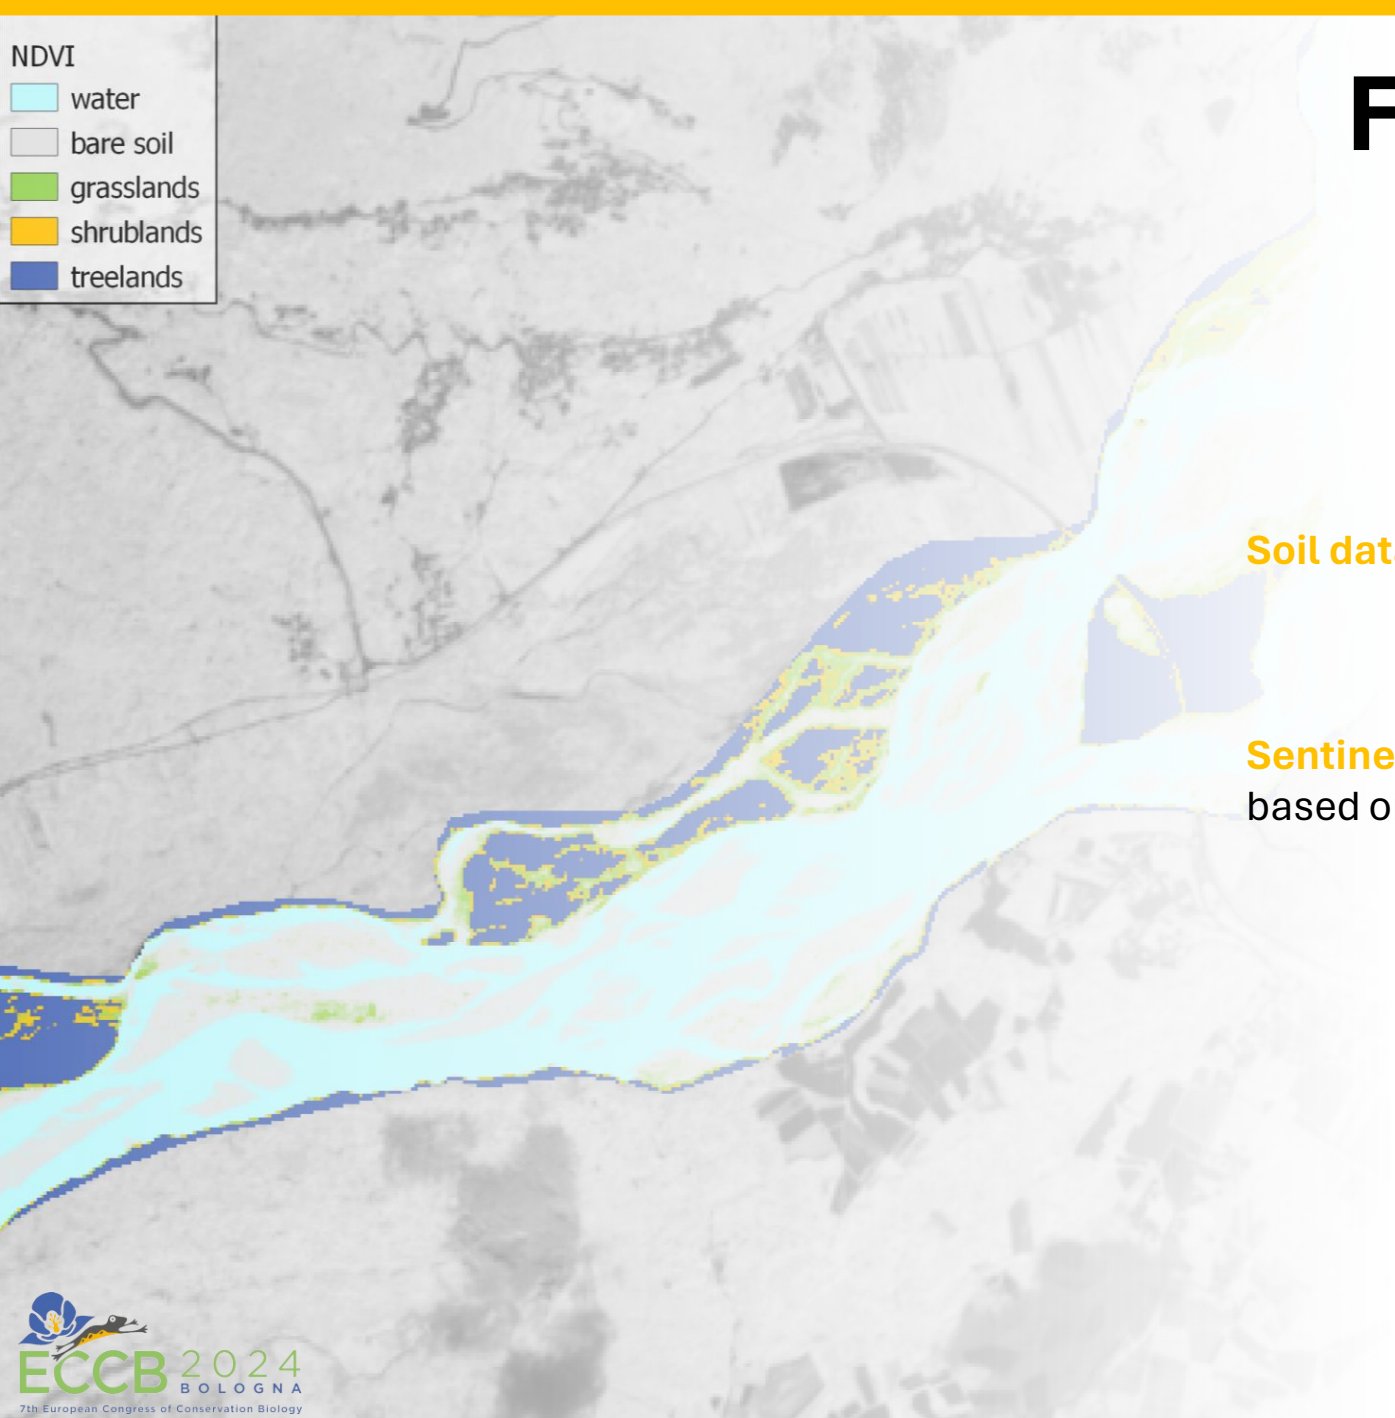

- NDVI
- water
 - bare soil
 - grasslands
 - shrublands
 - treelands

FUTURE PERSPECTIVES

Soil data have been collected but are currently under analysis

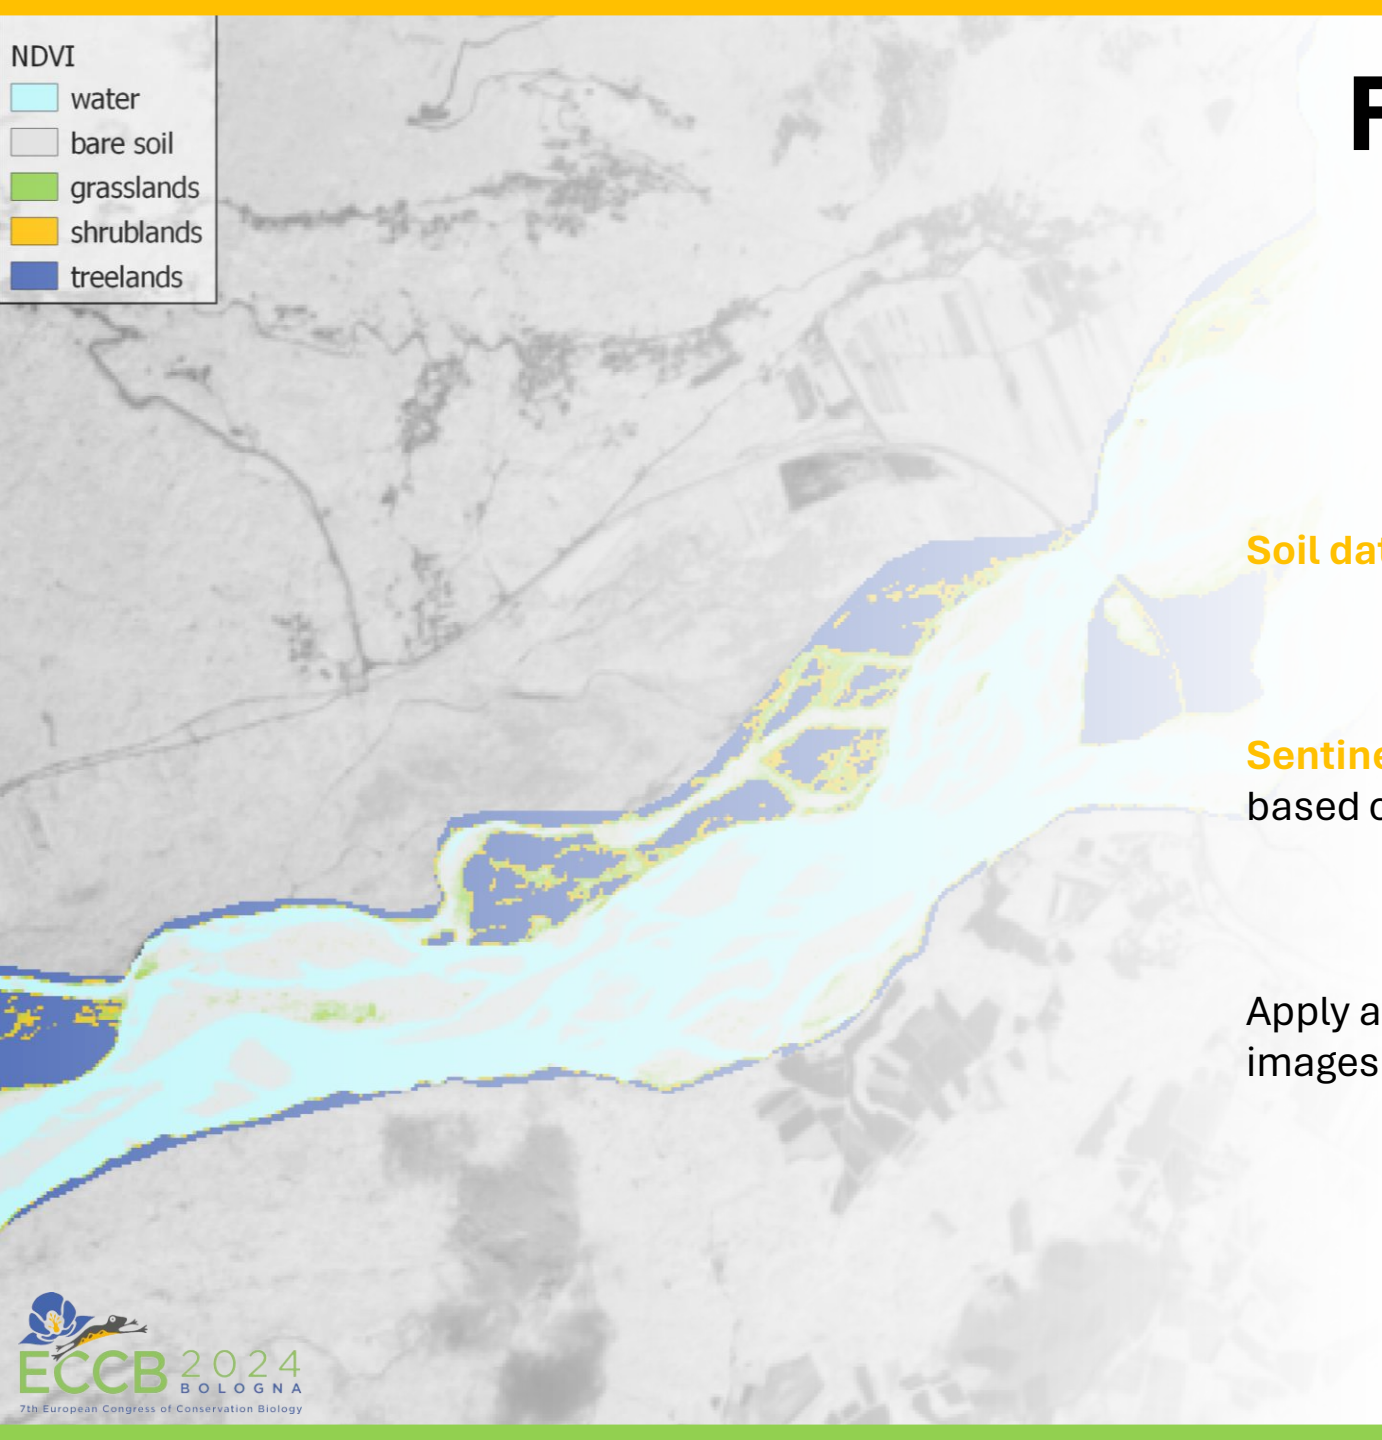

FUTURE PERSPECTIVES

Soil data have been collected but are currently under analysis

Sentinel-2 images (10x10m) could be used to classify river bars based on NDVI classes, with random on-site confirmation surveys

FUTURE PERSPECTIVES

Soil data have been collected but are currently under analysis

Sentinel-2 images (10x10m) could be used to classify river bars based on NDVI classes, with random on-site confirmation surveys

Apply an **automatic classification algorithm** trained on satellite images to classify the river bars and follow them in time
